

## ENVIRONMENTAL POLICY

Wapro aligns with the goals and ambitions of the Paris Agreement. Our innovative products are sold worldwide in two segments, Water and Sewage (VA) and Aquaculture. Our VA products protect people, property, and the environment from flooding and its consequences.

Within the Aquaculture segment, we primarily operate in land-based fish farming where our products can contribute to the production of food in a controlled, and in many respects, sustainable manner. The development of land-based fish farming can potentially help to reduce fishing in the oceans.

The restoration of environments after a flood, including nature and surroundings as well as buildings and infrastructure, requires a range of resources which in turn contribute to the carbon footprint (emission of greenhouse gases) that leads to global warming and other negative effects. Despite the difficulty in measuring the amount of greenhouse gas emissions saved when Wapro's products do their job, we assert that they make a significant difference by preventing the occurrence of emissions.

Wapro's commitment means that we will:

- Protect the environment by systematically integrating environmental work into our processes.
- Maintain and continuously improve our environmental management system to sustain high environmental performance.
- Prevent pollution and minimize the operation's emissions of greenhouse gases to the best of our ability.
- Comply with national and European environmental legislation, as well as other relevant requirements related to the environment and sustainability.
- Work to achieve self-set environmental goals, as well as a selection of the UN's Global Goals.
- Strive to develop products that help protect people, property, and environments.
- Develop products within Aquaculture that can contribute to sustainable cultivation of fish and shellfish.
- Be role models by setting requirements and disseminating information both upstream and downstream in the value chain we are part of.
- Communicate our environmental work internally and externally.
- Increase employees' competence and sense of responsibility regarding environmental impact and what is required of us to fulfil the Paris Agreement.
